Abstract (en)

Sealing device for sealing cavities occurring between a sheet pile profile and an adjacent flat boundary surface. The resulting cavities are filled by means of sealing devices which are smaller in size than said cavities to the extent that they can be readily fitted therein. Each sealing device consists of insulating material which is enclosed by packaging. The insulating material is resilient to such a degree that it expands to a larger size when the packaging is removed and comes to lie against the sheet pile profile and the adjacent part. The packaging is preferably fitted as a sleeve and the increase in volume is effected by removing said sleeve while holding the insulating material in place.
