Abstract (en)
Provided is a locking and unlocking apparatus with a dial lock which can easily be installed between a cabinet and an open/close member and operates reliably so that the locking and unlocking of the open/close member is appropriately conducted through a simple operation. When a door (2) is in the closed position and a dial lock (3) is in the unverified state, a locked state in which an engaging part (21) is engaged with an engaged part (11) is held. After the dial lock (3) is verified, the engaging part (21) is moved to an unlocked state by an operation of an operating part (22), the engagement of the engaging part (21) with the engaged part (11) is released, and the dial lock (3) is reset to the unverified state. When the door (2) is closed again, the locking and unlocking apparatus (A) automatically reverts to the locked state in which the engaging part (21) is engaged with the engaged part (11).
