Abstract (en)

[origin: WO2010121691A1] The present invention relates to a folding chair and particularly a folding child's high chair. The folding chair can be transitioned from an unfolded into a folded position, and comprises a seating surface (1) and a backrest (2), and a pair of first supports (3) supporting the seating surface (1) and the backrest (2), and a pair of two supports (4) connected by a hinge to the first supports (3). The seating surface (1) is rotatably disposed about a rotary axis (5) between the two first supports (3). The folding chair is characterized in that the backrest (2) is rotatably disposed about a rotary axis (6) between the two first supports (3) and can be displaced at a right angle to said axis (6), and the backrest (2) and the seating surface (1) are connected to each other by a connecting element (7) joined with a hinge to the seating surface (1) and the backrest (2), such that the backrest (2) and seating surface (1) are substantially at right angles to each other in a first unfolded position and are substantially parallel to each other and to the first supports (3) in a second, folded position.
