Abstract (en)
[origin: EP2423130A1] The container (1) comprises an interior compartment (7) closable against incoming of air from outside and bordered by a wall (14), and an operating position of the wall, in which the inner compartment has a volume. Another operating position of the wall is provided with inner compartment having a volume reduced against the former volume. A check-valve member blocks a flow of fluid from outside into the inner compartment. An operation position changing member (15) is provided for automatic conversion of former operating position into latter operating position in case of fire. An independent claim is also included for a retrofit kit for converting conventional container into container with a flexible wall.
