Abstract (en)
An adjustable hinge assembly for a glass door (5) has a frame fastening device (1), a door clamping device (2) and an adjustable device (3). The frame fastening device (1) is mounted securely to a doorframe (4) and has two pivot sections (111) protruding from the frame fastening device (1). The door clamping device (2) clamps a glass door (5). The adjustable device (3) has two pins (32) mounted between and respectively pressing against the pivot sections (111). Because two pins (32) respectively press against the pivot sections (111), pressing forces provided by the pins (32) are sufficient and the structure of the adjustable hinge assembly for a glass door (5) is enhanced. Accordingly, to frequently adjust the position of the glass door (5) relative to the doorframe (4) is unnecessary.
