Abstract (en)

[origin: FR2947892A1] The appliance has an instantaneous boiling type steam generator (12) provided with a tank (11) and connected to a stream distribution circuit through which steam is produced. The circuit comprises a pressurization check valve (150) of a distribution duct (15) that is connected to a stream diffusion unit (1) i.e. linen treatment accessory such as stem iron. The valve has discharging pressure, so as to pass the steam in direction of the diffusion unit when the pressure in the duct is higher than or equal to a predetermined threshold. A pump (14) is interposed between the tank and the generator.
