Abstract (en)

[origin: WO2011110980A1] The invention relates to a stand for a jump (10), in particular for equestrian showjumping, the stand (11, 12) comprising a support post (15) projecting upward from a base part (18) and at least one supporting part (13) for a jump bar (14) or the like which can be fixed on said post at various heights. The height of the supporting part can be adjusted by means of a motor-driven actuator which comprises an endless traction element (16) that is wrapped around guide and/or drive wheels (17, 21), for example in the form of a toothed belt, to the loaded strand (24) of which the supporting part (13) is connected. The design according to the invention is substantially insensitive to dirt, given the simple configuration, and can be disposed inside the support post.
