Abstract (en)
[origin: WO2010128847A1] The present invention relates to a lifting device comprising a base, an elongate arm, which is pivotally connected to the base with a first end for movement about a horizontal first axis, an elongate mast, which is connected with a first end thereof to a second end of the arm remote from the first end of the arm, and an engaging element, which is provided on a second end of the mast remote from the first end of the mast, said lifting device further comprising a lifting element comprising a base part and a lifting part, which base part is designed to be rigidly connected to the engaging part and which lifting part is connected to the base part, being designed to support an object to be lifted, said lifting part being connected to the base part for rotation about a third axis lying in an at least substantially vertical plane, which third axis is located under the engaging part. The present invention further relates to a lifting element, in particular for use in such a lifting device.
