Abstract (en)

[origin: WO2010129833A1] A system and method for using multiplexed RFID transceivers and RFID tags to verify connections and communicate the connection status to a host system is provided. RFID tags that are programmed with connection specific indicia are attached at or in proximity to various connections in a pharmaceutical or biotech processing system and interrogated by remote antennas driven by a multiplexed RFID transceiver. This enables a user to verify the status of each connection and communicate the connection status to a host system.
