Abstract (en)
A light fixture (300) is disclosed, which has a plurality of lighting elements, such as eyeball LED lighting elements (320), mounted in a support plate (310). The lighting elements (320) are movable in a convergent and divergent manner by means of a rotatable cam plate (330) which rotates the lighting elements such that their beam axes (A) move in radial planes extending from a central focus axis (F). The invention provides a convenient, low-profile mechanism for focusing movable lighting elements in a light fixture.
