Abstract (en)

[origin: WO2010130792A1] The present invention relates to an assembly formed from a planar rigid filtration membrane and generally flat plate (5) for accommodating and supporting this membrane (3), especially for the purpose of activating and/or revealing immobilized contaminants on said membrane, this support plate (5) having retention and immobilization means capable of cooperating with the periphery of the membrane (3), characterized in that said means comprise at least one non-deformable member (6) that projects from the general plane of said plate and which includes at least one stop tab (60), generally perpendicular to said plane (P), which is extended by a retaining appendage generally parallel to said plane, so that the engagement of said membrane (3) with said member (6) can take place only through a first movement (k) of the membrane substantially parallel to the plane (P) of the support followed by a second movement substantially perpendicular to said plane (P).
