Abstract (en)

[origin: US2010293417A1] The invention relates to an invention for the central monitoring of the operation of automated banking machines (ATM). The operating signals from actuators (31) and sensors (32) of an automated banking machine (ATM) are used to assemble operating characteristics of the actuators (31) and sensors (32) into data records from operating signal patterns (by time segments. These data records are transmitted from the automated banking machine (ATM) to a central monitoring device (20) in which the operating signal patterns are compared with operating signal patterns from corresponding earlier time segments. A trend toward a change in operating characteristics can be ascertained for the respective actuator (31) or sensor (32), which trend can be used for early replacement of said actuator or sensor.
