Abstract (en)

[origin: EP2431143A1] The method involves arranging a rotating basket in an idle position in a defined starting position and docking a battery at a charging station. An edit pulse causes decoupling of the battery from the charging station and rotation of the basket around an extrusion axis. A rocker is pivoted in the direction of a central axis of the pipe by a servo drive till it reaches the set insertion depth. An independent claim is also included for a device for cutting an extruded plastic pipe by a separating device.
