Abstract (en)
The present invention relates to a sill, such as for an outside door or an outside window. The sill (1) has a drainage duct (4) with a front longitudinal wall (2), a rear longitudinal wall (3), an upper wall (5) and a lower wall (6), as well as a collection channel (9) which, on a side (11) of the rear longitudinal wall (3) which faces away from the drainage duct (4), extends parallel to the drainage duct (4) and is delimited by the rear longitudinal wall (3) and by a bottom channel wall (10). At least one respective passage opening (20, 21) is provided in each of the front and rear longitudinal walls (3, 5), as a result of which the collection channel (9) is in liquid communication, via the drainage duct (4), with a drainage zone (25, 26, 36) situated outside the drainage duct (4). The invention furthermore relates to an assembly of such a sill and a stop element (60) and to a further assembly of a structural element (100), a pivotable or displaceable passage element (110) and such an assembly.
