Abstract (en)

[origin: EP2433677A2] The member has a glass keg (1) including a gas bubble-filled interior with a release liquid and two ends (2, 5) provided along longitudinal direction opposite to each other. One of the longitudinal ends of glass keg is friction-treated. The friction-decreasing treatment i.e. fire-polishing, takes place in the region of the longitudinal end of the glass keg. The friction-reducing treatment is made by applying an adhering coating (7) on the glass keg, where the coating is made by wax, lacquer or film. One of the ends of the glass keg is provided with a resulting tip (4).
