Abstract (en)

[origin: EP2434520A1] The device (1) has a connection unit (33) for mechanically connecting two separate switching pole housings (10) to a support pair and engaged in supports (28-31) forming the support pair. The supports form an undercut with respect to a dividing joint (32) that is formed between walls, which are faced together. The connection unit grips the undercut, and is individually formed at an outer housing according to a molding process. The outer housing forms a stopper for the support pair, where the stopper runs transverse to the dividing joint.
