Abstract (en)

[origin: WO2010136187A1] The invention relates to an exterior wall system (10) of a building (12), comprising a displaceable exterior wall (28) and a bearing (44) for the displaceable exterior wall (28). The displaceable exterior wall (28) separates an interior space (14) from a walkable exterior space (16), and is reversibly adjustable between at least two closing positions (50, 52) and can be locked in each of the closing positions, wherein the displaceable exterior wall (28) separates the interior space (14) from the outside in each of the closing positions (50, 52). The bearing (44), implemented as a track curve, is designed so that the displaceable exterior wall (28) is displaceable between an inner closing position (50) and an outer closing position (52), and at least one part of the exterior space (16) transitions to the interior space (14) in the outer closing position (52), thereby increasing the floor space thereof.
