Abstract (en)
[origin: WO2010136248A1] The invention relates to an electric lamp having a base and a transparent cover element connected to said base, comprising at least one luminous element that is arranged at a support attached to the base, wherein in the main emitting direction in front of the luminous element at least one reflector is arranged having a through-passage through which part of the luminous beam emitted by the luminous element passes, and at least one further light guiding means is arranged in the main emitting direction in front of the through-passage of the reflector such that the part of the luminous beam is reflected and/or emitted in a guided manner for generating a predefined light distribution at a reflection surface of the reflector.
