Abstract (en)

[origin: WO2010136408A1] The invention relates to a system for adapting data including at least one transmitter (101, 102) executing at least one caller application (131, 132) and a receiver (111, 112, 113) executing at least one called application (141, 142, 143), the transmitters and receivers being interconnected via a communication network (150), said caller application (131, 132) generating messages (181, 182, 202a) for said called application (141, 142, 143), said messages (202a) being structured according to a first syntax SA, said called application (141, 142, 143) being adapted so as to receive messages structured according to a second syntax SB, said system being characterised in that it comprises an ontological knowledge base (160) and a directory of services (170) common to the transmitters and the receivers, each transmitter (101, 102) comprising a translation module (120) connected to said base (160) and to said directory (170) for structuring said messages in accordance with the second syntax SB.
