Abstract (en)
[origin: EP2436425A1] The present invention relates to a uni-directional valve (1) for an air path of a ventilation device, comprising a flexible valve element (3), which is held biased in a housing (2) of the uni-directional valve (1) to close at least one air passage (8) located in a sealing section (9) of the housing with a sealing portion (18) in a sealing manner and to at least partially open the air passage (8) if the valve element (3) is impinged by a sufficient air pressure against the bias. It is proposed that the valve element (3) is designed as cylinder and that the sealing portion is located on the lateral surface of the cylinder (31), whereby the sealing portion (18) is located opposite to a support portion (20) located on the lateral surface of the cylinder (31), the support portion (20) interacting with a support section (22) of the housing (2), and whereby for causing the bias the distance between the support section (22) and the sealing section (9) of the housing (2) is smaller than the distance between the support portion (20) and the sealing portion (18) in the unbiased state of the valve element (3).
