Abstract (en)
[origin: EP2437135A1] The present invention is intended for a closing mechanism that has a first element movable according to its longitudinal direction adopting two positions defining the opening and closing positions of a closing element, wherein the first movable element can rotate with respect to a second movable element according to the rotation shaft defined by the longitudinal direction of the first movable element, allowing the first element to be placed in different relative positions to the case of said closing mechanism, and wherein the first element has some sloping sections that are antagonists of other sloping sections in the second element, so that due to the recovery effect of an elastic element solidly connected to the first element - second element assembly, the two positions between the first element and the case of the closing mechanism are defined.
