Abstract (en)

The personal emergency alarm device consists of the movement sensor (1) communicating with the control unit (2), which sets off the alarm sent to the surveillance centre (22), unless the movement sensor detects any movement during a time interval which the monitored person may set using the button (24). If the monitored person is not in emergency, he/she may reset the alarm delay by the button (13) on the wireless controller (11) before the alarm is actually set off.
