Abstract (en)

[origin: WO2010139535A2] A refrigeration device for storing goods in a cool place has a cooling chamber, the interior space of which is cooled during operation of the refrigeration device by means of cooling air that flows through a cooling channel of the cooling chamber. Said channel is formed by at least one wall section adjoining the interior space of the cooling chamber, which section hermetically closes off the cooling channel from the interior space of the cooling chamber and by means of which the thermal output can be transferred from the interior space of the cooling chamber into the cooling channel.
