Abstract (en)

[origin: WO2010142280A1] The invention relates to a lock for a motor vehicle, comprising a locking mechanism that includes a rotary catch and a pawl. The aim of the invention is to make it easier to lock a lock of said type. In order to achieve said aim, the rotary catch of the claimed lock comprises a stop which projects upward from the rotary catch in the form of a bolt, for example. Furthermore, a clip is provided which can be moved towards the stop by means of a motor in such a way that the rotary catch is rotated from the preliminary locking position into the main locking position. Hence, a motor is used to reach the main locking position from the preliminary locking position, thus making it easier to close a vehicle door.
