Abstract (en)
[origin: WO2010144045A1] The invention relates to a shade device (1) for windows. The device comprises an upper bar (3), on which a cloth (4) is arranged to be unrolled or rolled up. The cloth (4) is partly permeable to light. The cloth is arranged to run about a lower bar (8) and to be drawn upwards so that, in this way, the cloth may be caused to overlap itself. An outer end of the cloth (4) may be attached to flexible straps which are rolled on reels on the upper bar and which straps have a length which is less than the length of the cloth.
