Abstract (en)

[origin: EP2441682A1] The device has a set of longitudinal downstream channels (32) arranged in a downstream ramp (2) to deposit compressed tablets that are lead in cells of a projected blister strip. A set of longitudinal upstream channels (31) is arranged in an upstream ramp (1) to supply the tablets in an arrangement such that each downstream channel is associated to two of the upstream channels. A setting unit sets the upstream channels in communication with the corresponding downstream channel through transversal displacement of the upstream ramp with respect to the downstream ramp. Independent claims are also included for the following: (1) a machine for packaging compressed tablets in cells of a blister strip (2) a method for implementing a channelized dispensing device.
