Abstract (en)

A mounting support for a construction panel, comprising a mounting surface for receiving the construction panel in a mounting plane. According to the invention, the mounting surface exhibits one or several first portions, which are covered by an adhesive for forming an adhesive joint with the construction panel when the construction panel contacts the adhesive, and one or several projecting portions, which are adapted, on the one hand, to form a support for the construction panel so that the construction panel can be moved freely back and forth in the mounting plane without causing the construction panel to contact said one or several first portions when the construction panel is pressed against the mounting surface with a force smaller than a predetermined pressing force, and, on the other hand, to be deformed or penetrate into the construction panel when the predetermined pressing force is exceeded to allow the construction panel to get in contact with said one or several first portions so that an adhesion joint is formed between the construction panel and the adhesive. The invention also relates to a method for mounting a construction panel by means of such a mounting support.
