Abstract (en)  
[origin: EP2442039A1] A conditioning plant (1) comprises a general inlet (2), a general outlet (3), a circuit (4) which sets the general inlet (2) in fluid communication with the general outlet (3), a plurality of users (5) arranged on the circuit (4), and a balancing system (20). The balancing system comprises a sensor (21) for detecting at least a real value depending on a difference of intensity between upstream and downstream of the users, of at least a physical parameter of the fluid; the balancing system further comprises a flow regulating organ (24), and a control device (25) connected to the sensor (21), acting on the flow regulating organ (24) and configured for enabling memorisation of at least a reference value of a same physical parameter of the fluid, comparing the reference value with the real value, commanding the regulating organ (24) to regulate the fluid internally of the circuit (4) such as to maintain the real value substantially aligned with the reference value.
