Abstract (en)

[origin: WO2010147477A1] The application concerns a method and a system for measuring correlation between different parameters related to visual function and collecting data. A plurality of measuring apparatus and at least one apparatus for visual stimuli are set up around the head of the test person. Trigger signal are connected from a coordinating device to each individual apparatus, and at least one criterion is provided in the coordination device determining when the trigger signal is to be issued to the connected devices. Measured data is stored in a database related to the criterion for issuing the trigger signal.
