Abstract (en)

[origin: WO2010145943A1] The invention relates, inter alia, to an operating device (10) having an operating lever (20) for controlling a vehicle, particularly for controlling a locomotive engine or a traction vehicle. According to the invention, the operating device comprises a control device (50), which allows a position-dependent operating mode (BA=0) and a time-dependent operating mode (BA=1) of the operating device, and a selection device (60), which allows the operator to select the position-dependent operating mode or the time-dependent operating mode of the operating device, is connected to the control device. Depending on the selected operating mode and the respective position of the operating lever, the control device is suited to generate a control signal (ST) on the output side, which determines the respective operating command (BF) of the operating lever.
