Abstract (en)

[origin: EP2444861A1] The device (101) has a planet carrier (113) on which a planet gear (115) is mounted free in rotation. The planet gear occupies two positions in which the planet gear is kinematically connected to driven wheels e.g. winding system's wheel (105a) and rapid date correction system's wheel (105b), respectively. The planet gear is kinematically connected to inner gear teeth. An actuating unit i.e. actuating finger (113c), actuates the planet carrier to select different positions or functions. A positioning unit i.e. control lever index (117a), positions the planet carrier in the positions. An independent claim is also included for a movement for a timepiece, comprising a selection device.
