Abstract (en)

[origin: WO2010151146A1] Method for manufacture of floating docks in which a block of a buoyant material is casted in a settable mass, particularly concrete, while channels are formed at the top side of the block of buoyant material for pulling service cables, like water pipes, power cables and signal cables, there through. A covering layer of assembled module elements are put on a base block of buoyant material, the module elements being molded with U shaped grooves at their bottom side to form at least one longitudinal channel for a service cable. The central feature of the invention is the application of pre-manufactured elements (23, 36) with U-grooves at their bottom side for forming channels for pulling service cables directly there through.
