Abstract (en)
[origin: WO2010149381A1] The invention relates to a tube (12) having an end wall (21) at the front end thereof that constitutes one of two substantially complementary parts (21a, 21b), wherein an outlet nozzle (17) is disposed completely at only one of the two end wall sides (21a, 25b). The rear closure end (19), curved along part of the generatrix of the tube (12), is offset in the same direction, opposite the longitudinal axis of the tube (12). A device for emptying said tube (12) comprises a tube-shaped housing (9, 11) having a press-out body (20) that can be displaced therein and that is guided by means of two diametric axle journals (18) in axial slits (13) of the housing (9, 11). The axle journals (18) engage with an internal thread (10) of a rotatable sleeve (8) enclosing the housing (9, 11). By rotating the sleeve (8) relative to the housing (9, 11), the press-on body (20) is displaced in the direction of the outlet nozzle (17).
