Abstract (en)

[origin: WO2010149623A1] The invention relates to a support device for a facade system, for directly or indirectly fixing at least one essentially panel-type wall-covering or ceiling-covering element (3) to a support structure of a building, comprising a first essentially L-shaped section (1) for connecting the support device to the support structure or to a substructure fixed on the support structure and at least one second essentially L-shaped section (2) for connecting the holding device to the wall-covering or ceiling-covering element. The second profile can be connected to the first profile by inserting the profiles into one another in a form-fitting manner so that in cross-section the holding device has an essentially box-like outer contour in the region of the two sections which are inserted into one another. According to the invention, the first and/or second section (1, 2) is reinforced by the arrangement of at least one web (5) which runs transversally or diagonally to at least one limb (1.1, 1.2, 2.1, 2.2) of the corresponding section and which forms a chamber (4). The invention further relates to a facade system comprising such a support device.
