Abstract (en)
[origin: WO2010149625A1] The invention relates to a support bracket for a facade system, for directly or indirectly fixing at least one essentially panel-type wall-covering or ceiling-covering element to a support structure of a building, comprising a first limb (1) designed to be fixed on a support structure of a building and a second limb (2) lying perpendicularly to the first limb (1) for fixing to a support section of a facade system. The second limb (2) of the support bracket is equipped with at least one spring tongue (3) which fixes a support section with a clamping action. According to the invention, the support bracket further has a plate (5), at least one part of which lies at a distance to the second limb (2) and defines an insertion opening (4) for receiving and guiding a support section in a longitudinal and transversal direction. The invention also relates to a fixing device comprising such a support bracket, and a facade system which comprises such a fixing device.
