Abstract (en)

[origin: WO2010149615A1] The invention relates to a method of transmission for a wireless network comprising a plurality of stations transmitting at one and the same frequency. In order to optimize the use of the radio channels, the method comprises the following steps implemented by at least one relay station RS of the plurality of stations: reception via a first wireless channel of a first signal (512) representative of data (503); and transmission via a second wireless channel of a second signal (514) representative of the same data (503) received destined for an assembly comprising at least one receiver, the second signal being transmitted in a manner synchronized with a third signal (504) representative of the same data (503) and intended to be transmitted by at least one base station BS1 of the plurality of stations. The invention also relates to the corresponding method of reception.
