Abstract (en)

[origin: EP1814316A2] When a main shooting subject is moving, the movement of the main shooting subject naturally viewed and recognized by a user is different from an actual frequent movement of the main shooting subject. If the display of an object identification mark accurately follows up a moving object, the visibility of the mark may deteriorate. The present invention provides a display method (110) for differentiating the follow-up response characteristics of the mark depending on a shift direction of a main shooting subject. For example, the follow-up response of the mark is lowered if a main shooting subject causes an up-and-down motion.
