Abstract (en)

[origin: EP2450509A2] The universal locking device (100) has an electro-mechanical drive mechanism (150) that is electrically driven, such that locking elements (111,112,114) within the housing are moved to a locking position or to an unlocking position. The movement of wing along specific direction is blocked corresponding to the locking position of the locking elements that are engaged with an engagement recess. The movement of wing along specific direction is released corresponding to the unlocking position of locking elements that are disengaged from the engagement recess. An independent claim is included for swing door system.
