Abstract (en)
[origin: WO2011004002A2] The invention relates to a container (2) for use with a hand-held device (6), in particular for dental purposes, for dispensing a pasty filling compound, the viscosity of which can be reduced by supplying vibration energy, wherein the container (2) is designed to receive the pasty filling compound and comprises a discharge opening (8) at the front end for dispensing the filling compound. The discharge opening (8) is formed by a cannula (4), which is made of steel, for example. The viscosity of the filling compound can be positively influenced by the cannula (4). In this way, in particular a significant increase in the liquefaction degree of the filling compound can be achieved.
