Abstract (en)  
[origin: WO2011003425A1] The present invention concerns a valve with at least two functional positions, where a first position produces connection to a first passage, and where a second position produces connection to a second passage, where the valve forms part of a construction with a compressor, preferably a compressor in a tyre repair kit, where the tyre repair kit additionally includes at least a magazine with sealing mass. The valve according to the invention is a rotary valve, where the first position forms a passage for compressed air to an outlet therefor, and where the second position forms a passage for compressed air to the magazine with sealing mass. It is thus possible to use the compressor in the tyre repair kit for other purposes than in connection with repair of a punctured tyre. For example, the compressor may be used for occasional checking the tyre pressure in the wheels of a car, in a wheelbarrow or a bicycle, or even for various other purposes which in principle have nothing to do with the vehicle.
