Abstract (en)

[origin: EP2273407A1] The method involves transmitting an executable computer code i.e. secure agent code (25), to an electronic device by a controller. The agent code is executed by the device. Information related to whole or part of electronic components (22-24) is collected by the agent code, where the electronic components compose the electronic device. A print (29) of the electronic device is created from the collected information. Whole or part of nonfixed data i.e. random number, exchanged between another electronic device and the former electronic device is secured using the print. The information is a number of series and technical characteristics.
