Abstract (en)  
[origin: WO2011003907A1] An optoelectronic component, comprising a semiconductor body (1) and a carrier substrate (6), which is connected to the semiconductor body (1) by way of a solder joint (7), is provided, wherein the carrier substrate (6) comprises a first aperture (8a) and a second aperture (8b), through which a first electrically conductive connecting layer (9a) and a second electrically conductive connecting layer (9b) are guided from a first primary surface (11) of the carrier substrate (6) facing away from the semiconductor body (1) to a second primary surface (12) of the carrier substrate facing away from the semiconductor body (1), the carrier substrate (6) is made of a semiconductor material and has side flanks (10), which run obliquely to the primary surfaces (11, 12) of the carrier substrate (6) at least in a first partial region (10a), wherein the side flanks (10) are provided with an electrically insulating layer (13) in the first partial region (10a).
