Abstract (en)
A watercraft comprises a stabilizing unit (10) having a stabilizing appendage (12) located below the water line of the watercraft, actuator means (40), at least partially located within the watercraft and connected to the stabilizing appendage (12) to transfer a rotary motion thereto, about a longitudinal axis (X-X) substantially perpendicular to the watercraft hull, and an electric motor (11). Advantageously, said electric motor (11) is a torque motor (11) which is directly and operatively connected to actuator means (40) to cause movement thereof, and hence movement of the connected stabilizing appendage (12) about the longitudinal axis (X-X).
