Abstract (en)

Apparatus for lifting and moving by means of manual power of objects around and near the earth base that is easily transportable, characterized in that two levers with supporting points on the earth base, which stand in an angle and opposite each other relative to the perpendicular line from the earth base, with minor exertion of force, in any case by means of a transmission, are moved towards each other in such a way that the angle in between is decreased, as a result of which hoisting lines that are connected to these levers and which form an angle relative thereto and which, in their turn, are connected to the object that is to be lifted, are pulled upwards, after which the object by a tilting movement of the apparatus relative to the supporting points or movement of the supporting points on the earth base can be moved.
