Abstract (en)
[origin: EP2453100A2] The joint has bars (2, 3) whose recess (14) and borehole (20) or slots are attached to supports that are adjustable against each other. The supports are formed from thread-forming bolts (8) that are supported at a wall of the borehole, and a sliding block (9) attached to the bolts and engaged into the recess. The bolt and the sliding block are accommodated in a narrow groove (10) running axial to the borehole. The groove is extended via the recess in sections. A centering point is arranged upstream to a thread-forming section.
