Abstract (en)

[origin: EP2453102A1] The device i.e. locking key (100) has a pin (112) mounted on closing panel (9) in vicinity of upper wall (91) of the panel. A latch (120) is completely or partially mounted to move in rotation relative to the panel between positions. The latch does not interact with end cheek plate (7), and does not oppose removal of the panel relative to a tunnel housing (2) in one of the positions when the pin is mounted on the panel. The latch interacts with the plate for locking the panel relative to the plate in another position when the pin is mounted on the panel in position relative to the housing. An independent claim is also included for a closing or sun protection facility, comprising a box.
