Abstract (en)  
[origin: WO2011007260A2] An RFID label sheet has a substrate having a first area and a second area. A support sheet having a window portion and a frame portion is attached to the substrate, with the window portion exposing the first area and the frame portion covering the second area. The support sheet has a top layer and a bottom layer adhered to the substrate. An RFID label is removably attached to the substrate and covers the window portion. The RFID label has a face layer and an inlay laminated to the face layer. The top layer of the support sheet and the face layer of the RFID label form a surface capable of recording visual signs thereon. The present invention provides RFID labels in discrete flat sheet form which allows creation of visual signs onto RFID labels by common printing equipments such as office or home-use printers or even with pens.
