Abstract (en)  
A forcible moving mechanism includes a first urging body to apply an urging force toward a drawn-in position to a latch body in a standby position. A striker body is captured at a prescribed position by the latch body held in the standby position, and a movable body is moved up to a position at end of movement by relative movement of the latch body to the drawn-in position by release of the hold on the occasion of the capture. A damping mechanism includes a contact part to contact with the latch body constituting the forcible moving mechanism and a second urging body to urge the contact part in an advancing direction. The damping mechanism is constituted so as to apply a resistance to a retraction of the contact part accompanying the movement of the latch body to the drawn-in position.
