Abstract (en)

[origin: EP2456021A1] The outlet (700) has a cylindrical wall (400) for defining a bore and receiving lateral uprights (410) extended in projection from an inner face (401) of the wall parallel to a longitudinal axis (X) of the wall. A flap (600) closes a section of the bore, and is movable in translation with respect to the wall along the longitudinal axis. The lateral uprights are movably mounted in translation on the wall, so as to be moved jointly with the flap. Each lateral upright is movable between a withdrawal position and a closing position.
