Abstract (en)

[origin: WO2011011002A1] A method, system, and article are provided for efficiently and effectively searching an electronic document collection. Each of the documents in the collection is pre-divided into sub-sections. One or more profiles are created, each including a selection of at least one of the sections of the documents in the collection. In addition, a weight is assigned to each of the selected sections in the profile. Based upon the parameters of a query and selection of a profile, select sub-sections of each document are employed to compare query data to the underlying document collection. A compilation of documents is created with data matching the query data, and a relevancy score is computed for each document in the compilation. The relevancy score is then leveraged to sort the documents in a manner to convey relevancy to the query submission.
